

# Da-M-I-C-Us Classifier — README

The classifier turns any AI capability into a Da-M-I-C-Us string and evaluates it against a policy. It describes what is; the Policy Maker defines what is permitted. Current file: **damicus-v2\_classifier\_r3.html** (revision stamped in the footer). One file, any browser, works offline; nothing leaves your machine.

## Classifying

**Fast path.** One badge per dimension — Data, Model, Infrastructure, Code, Use — five taps to a verdict. The string builds live in the strip.

**Guided path.** “Not sure? Help me choose” on any step derives the code from plain questions. If model-weight availability can’t be established, the app shows **Information Needed** and stops — an unknown never silently becomes CM.

**Composites.** “+ Add adaptation data” (fine-tune, LoRA, RAG) composes Data; “+ Add composed model” composes Model, per Draft 2 §7. Policy matching checks every member.

**Use.** Pick BU / PU / IU / DU directly, or Unset for a capability classification. The guided path first asks whether you are classifying a capability or a specific deployment. A capability produces a four-part string (WD-CM-MI-CC) and no verdict — instead it lists which rules could admit it, and at which Use.

## Reading the result

The verdict applies to the full string, never one code: **Allowed**, **Approval required**, **Not allowed**, or **No verdict — Use not set**. Green appears only on verdicts. The result names every matching rule — overlaps are reported (“Also matches...”). An exact intrinsic match to a Draft 2 common class is identified (K1–K7, e.g. “K1 · Frontier Commercial Model”). The passport donut shows the five fills at a glance; for composites it shows the highest-exposure member, consistent with Draft 2’s high-water principle. The why-table shows each rule’s pass or failing gate.

## Policies

The built-in policy is the VES illustrative internal policy from Draft 2 (P1–P4 permitted · P5 by approval). The POLICY selector loads an organisational policy instead: Copy JSON in the Policy Maker, paste it here, and every verdict, table and snapshot evaluates under your policy. **damicus-v2\_policy\_ves.json** ships as a schema reference and first paste.

## Exports

**Snapshot** exports the result as a card — string tiles, passport donut, verdict, policy line, legend — as PNG, SVG or print-PDF. **Copy JSON** copies the classification in the machine encoding: composites as arrays, “Us”: null for capabilities, plus the string and any K-class. **Copy** beside the string copies the string alone.
