

# Compare Shell — how it works

Compare is the home screen. Left: what the deployment **is**. Right: what the organisation **permits**. The circle between them: the **verdict**. File: **damicus-v2\_compare\_shell\_r6.html**.

## Classify (left)

Paste a string and press Load — **WD-CM-MI-CC-PU**, composites like **WD+PD-OM-SI-OC-IU**, or a four-part capability (no Use, no verdict). Or tap the icon chips, one per dimension; the dashed chip means Use unset. “or Classify...” opens the reference Classifier.

## Policy (right)

Pick a policy from the chooser. **Import policy (JSON)**... takes the Policy Maker’s Copy JSON; **Define policy**... opens the Policy Maker itself.

## Verdict (centre)

The circle shows the deployment; its centre is the verdict — ALLOWED, APPROVAL, NOT ALLOWED, or NO VERDICT for capabilities. Each policy rule shows ✓ or ×, **DECIDES** on the rule that carried it, and on a miss, **why**: “fails: Us{DU}”.

## Put it online (Netlify)

Phones need a URL — file previews won’t run it. Put **index.html**, **damicus-v2\_classifier\_r4.html** and **damicus-v2\_policymaker\_r9.html** in one folder, drag the folder onto **app.netlify.com/drop**, and open the address it gives you. index.html is the shell, so the site lands on Compare; the two links work because the files sit beside it.
