

Da-M-I-C-U-s Policy Maker — README

The classifier describes what a capability is; the Policy Maker defines the space your organisation allows it to occupy. A policy is one or more **rules**; each rule is a permitted set across the five dimensions plus the action your organisation attaches to it. Current file: **damicus-v2_policymaker_r8.html** (revision stamped in the footer). One file, any browser, works offline; nothing leaves your machine.

Building a policy

- 1. Policy header.** Give the policy a short ID (e.g. VFX-01), a name, and a company or individual. The owner appears on the seal centre for custom policies.
- 2. Start a rule.** Load a common class (P1–P5) as an editable template, or start blank.
- 3. Define the permitted set.** In each dimension select one or more codes, or ANY (★). ANY and individual codes are mutually exclusive — picking one clears the other. Your selection order is preserved in the notation and the seal.
- 4. Read the live seal.** Sub-slices show each permitted value with its icon, code, and exposure fill; dotted dividers separate values, solid lines separate dimensions. An exact common-class set takes that class's identifier ring, P-number and ring lettering; any modification reverts to the neutral ring with your owner/ID. Ring colour is identity only — never exposure, never verdict.
- 5. Set the Action.** Permitted or By approval. An **action** is what your policy declares; a **verdict** is what a test decides. Green appears only on verdicts.
- 6. Save; add more rules.** Rules stack as cards — edit or delete any. An incomplete rule is blocked, with the missing dimensions named and marked.

How matching works

Allow-list only, per Draft 2. A deployment matches a rule when every dimension value — including every member of a + composite — sits inside that rule's set. Matching any one rule is sufficient; where rules overlap, the most permissive matching rule decides, and all matches are reported. No match means not allowed; there are no deny rules.

Testing a classification

Paste a string into the test box: four parts for a capability classification (WD-CM-MI-CC), five for a deployment (WD-CM-MI-CC-PU), "+" composites in Data and Model (WD+PD-OM-SI-OC-IU), "unset" for an explicit capability. The verdict names the rule that decided it and any additional matches. Every tested result exports as a snapshot card (PNG / SVG / print-PDF) naming your policy and the matching rule.

Exports

Copy JSON produces the machine-readable policy object — paste it straight into the classifier's POLICY selector to evaluate any classification under your policy. The **policy card** snapshot renders every rule with its seal, notation and action, plus the fills legend and the matching semantics, as PNG, SVG or print-PDF.
